## Summary

Level of confidence:	95%
Variance	p=q=50%
Sample size:	2,000 individuals
Sampling error:	± 2.69%

**Scope:** Catalonia

**Univers:** Spanish citizens of 18 years of age and more who live in Catalonia

**Method of data collection:**

Computer Assisted Personal Interview (CAPI)

**Sampling procedure:**

Stratification by province and town size, with selection of last sample units (individuals) using sex, age and place of birth crossed quotas.

Town size is divided into 6 categories:

- less or equal to 2,000 inhabitants
- from 2,001 and 10,000 inhabitants
- from 10,001 and 50,000 inhabitants
- from 50,001 and 150,000 inhabitants
- from 150,001 and 1,000,000 inhabitants
- more than 1 million inhabitants

To calculate the quotas we use the official statistics from the *Padró continu de població* from the year 2014. The age quotas correspond to the following intervals:

- 18 to 24 years of age
- 25 to 34 years of age
- 35 to 49 years of age
- 50 to 64 years of age
- 65 and more years of age

### Sample size:

**2,000 interviews** with the following territorial distribution:

• Barcelona	800
• Girona	400
• Lleida	400
• Tarragona	400

### Allocation:

**Not proportional.** To obtain representative figures for the whole Catalan population, the results have been weighted by the following territorial weights:

• Barcelona	1.8650318387
• Girona	0.4675226517
• Lleida	0.2841606232
• Tarragona	0.5182530476

### Sampling error:

The overall margin of error of the survey is **± 2.69%**, for a confidence level of 95% (1.96 sigma) and under the assumption of maximum indetermination (p=q=50%). In each province the margins of error are:

• Barcelona	± 3.46%
• Girona	± 4.90%
• Lleida	± 4.90%
• Tarragona	± 4.90%

### Fieldwork:

The fieldwork has been performed by Opinòmetre, from the 2<sup>nd</sup> to the 24<sup>st</sup> of June 2015.

### Methodological note:

Some trend figures presented in this abstract refer to a telephone survey (CATI) performed in December 2014, the Survey about the Catalan political situation, 2014.

Given that we have only drawn a sample from the population (those over 17 years of age, living in Catalonia and with Spanish citizenship), all results are subject to a sampling error, meaning that not all the differences in the same questions in other waves of the Barometer are statistically significant.

For instance, in a survey question where the 50 % (the worst case scenario in terms of the margin of error) gives a particular response, with a sample of 2,000 interviewees, it is 95% sure that the “true” value in the population falls into the range of  $\pm 2,69$  of the results in the sample, this is, in between 47.31% and 52.69%.

The subsamples in two-way tables are subject to an even larger margin of error. Therefore, the conclusions that could be drawn have to be taken with caution.
